

# Morsoy Offers Lines That Stand Up To Adversity

**CASH, ARK.**

**S**oybean harvest is in full swing in most areas and in a few areas is winding down. The 2010 growing season brought with it a lot of challenges. Extremely hot and dry conditions plagued the area and created difficult growing conditions to say the least.

We have, however, had some bright spots through this difficult year. In 2010, Morsoy Genetics introduced the "Morsoy Xtra" line of Round-Up Ready 2 Yield Soybeans. This is the next generation of Round-Up soybeans with increased yields.

The Morsoy Xtra 48X00 is a new promising variety. This soybean has shown great yield potential on light to mixed soils in the early testing with select areas in the Bootheel of Missouri cutting as much as 82 bu/ac. The Morsoy Xtra 46X29 is also a new variety that fits the mixed to heavier soils and has shown excellent yields.

The Morsoy Xtra 49X10 is another new introduction that fits most soil types and has shown to be an excellent yielder.

We also offer our Morsoy line of Round-Up Ready 1 Soybeans such as the 4706 which is a great choice for lighter soils, the 5168 which is an indeterminate best suited for mixed to heavier soil types, and the 5388 which adapts to most soil types and has an excellent disease package.

As an alternative to the Round-Up Ready system, Morsoy has 2 conventional soybeans. The CB 4860 and CB 5209 are excellent yielding soybeans with good disease packages which fit most soil types.

Contact your local dealer or Morsoy representative and ask about Morsoy Soybeans or visit our website at [www.crvseed.com](http://www.crvseed.com), to find out more about these varieties and many more.    Δ
