

Quality Grain Storage Is Two-Step Process

EDON, OHIO

In Storage Grain Quality Management is a two-step process: First put the grain in the bin correctly with an AgriDry Gravity Grain Spreader. The AgriDry Grain Spreader distributes the fines throughout the bin for more uniform airflow through the grain when you run your aeration fans.

Second run your aeration system correctly with the AgriDry Bullseye Controller. The Bullseye Controller monitors the temperature of the stored grain and operates the aeration system when the outside air temperature and the relative humidity are able to correct the grain temperature without changing the moisture content of the grain.
