

# Since 1980 US Wheat Exports Down By Half While Competitors' Exports Double

DR. DARYLL E. RAY  
Agricultural Economist  
University of Tennessee

From 1993 to 2009, domestic demand exceeded exports in 14 of those 16 years. This happened not because domestic wheat consumption has trended upward, but because US exports have declined over time. While US wheat exports have dropped markedly in terms of proportions of utilization and of production, those trends do not characterize the world-wide wheat market.

Since 1980, the percent of world wheat production entering the export/import market has been flat to down slightly (Fig. 1). During the 30-year period from 1980 to 2009, the production of wheat around the world grew by 52 percent while wheat exports grew by 36

We continue our look at agricultural exports. Last week corn exports were the focus; this week we look at wheat. Historically, exports have dominated the US wheat market. For the 32 years from 1960 to 1992, US wheat exports exceeded domestic consumption in all but 7 years. But now it's the other way around.

exports declined by one-half while the quantity of Non-US exports doubled.

With the adoption of the 1985 Farm Bill, the US embarked on an export oriented grain marketing strategy by reducing the loan rate in the belief that the loan rate was holding the US price above the "world price." It was expected that by allowing the US price to fall to the "world price," US grain exports – in this case wheat – would increase, displacing grain exports among our main international competitors.

But, as already mentioned and shown visually in Figure 2, US wheat exports have been on a downward trend, especially since 1987, while non-US exports have increased.

When we look at the US farmgate price of wheat (solid line) in Figure 3 we see that it is closely related to the farmgate value of wheat exports (dashed blue line). If the low price strat-

percent.

In 1980, the US sold 1.5 billion bushels of wheat into the world export market (solid line) for a 45.7 percent share of the worldwide market (Fig.2). Twenty-nine years later, US exports are down to 0.8 billion bushels, while Non-US wheat exports – exports of US wheat-export competitors – jumped to 3.7 billion bushels, up from 1.8 billion bushels in 1980 (dashed line).

In essence, between 1980 and 2009 US wheat

egy of the post-1985-Farm-Bill era were to have brought prosperity to crop agriculture as it was argued it would, export levels should have had to have increased at a rate faster than the rate of price decline, thus increasing the value of exports.

Clearly that did not happen.
