

Sunco Planter Attachments Bring Ease To Farming System

NORTH PLATTE, NEB.

Sunco has been building planter attachments for over 25 years. Sunco's goal has been to make NO-TILL FARMING more efficient and cost effective for the farmer.

The current Nutri-Mate 3 is the third version of this quality unit. The unit is designed to be mounted to the row unit of the planter, the parallel links let the Nutri-Mate 3 float and the row unit gauge wheels provide depth control so nutrients are precisely placed in relation to the seed. The unique frame design allows the discs to be pulled through the field. This design also allows the discs to pivot slightly to the left or right to keep the fertilizer opener discs trailing properly on curves and contours. This improves planter tracking, reduces bearing and disc fatigue, plus eliminates stress on the parallel

linkage. The Nutri-Mate 3 can be set to place the fertilizer 3 different distances from the seed and at 3 different depths.

The Saber Tooth Trash Discs can be used with the Nutri-Mate 3 or by themselves. The concave discs with swept back teeth are offset so that one disc runs ahead of the other disc. These three features make this unit very unique. The Saber Tooth Trash Discs will not plug, they do not need soil contact to turn, and will not grab or spear the trash. The Saber Tooth Trash Discs can be set at the surface of the soil and just contact the trash and roll it out of the way. No soil needs to be moved.

Both Sunco products are covered by several patents and are only manufactured by Sunco.
