

Wheat Data Available

URBANA, ILL.

The University of Illinois Variety Testing program began in 1934. Crop performance tests are conducted annually to provide farmers, extension personnel, and private seed companies with agronomic information on hybrids and varieties of the major Illinois field crops. The trials are professionally managed and conducted in a research-based manner to

minimize variability and insure the integrity of the results.

The 2009 Wheat data is now available and can be accessed on the Sangamon-Menard website under Agriculture & Natural Resources under the "Variety Testing Program" go to <http://sangamonmenard.extension.uiuc.edu>.
